

We turned the API section into a sellable product path.

Public page, documentation, pricing, and the broken FX v1 lane were repaired around one clear motion: sandbox first, free verified key second, paid pilot third.

7

public v1 product endpoints documented

\$149

API Growth pilot entry price

\$499

API Pro pilot price

100/day

free verified-key limit

WHAT CHANGED

The surface now speaks to external buyers, not internal operators.

The old experience mixed product copy, internal pilot language, old docs, and route drift. The new structure explains who the API is for, what is live, how to test it, and when to sell paid access.

/api/

Rebuilt as a public product page with use cases, endpoint catalog, sandbox quick test, trust signals, and pricing preview.

/api/docs/

Rebuilt as practical developer docs covering auth, sandbox keys, limits, endpoints, errors, and production path.

/api/pricing

Rebuilt as a buyer-ready pricing ladder: Free, Growth, Pro, Enterprise/custom.

WORKING PRODUCT

The API can now be sold around a concrete catalog.

ENDPOINT	BUYER VALUE	TEST PATH
POST /tax/payee	PAYE gross-to-net and reverse salary scenarios.	Sandbox key
GET /tax/rates	PAYE and VAT reference data by country.	Sandbox key
POST /vat/calculate	VAT add-or-extract flows for supported markets.	Sandbox key
GET /fx/rates	Currency pair, base conversion, and selected history.	Live or sandbox
GET /fuel/prices	Fuel-price data with source and timestamp.	Live or sandbox
GET /rates/central-bank	Policy rates and inflation reference data.	Live or sandbox
GET /countries	Country metadata and available API products.	Sandbox key

The broken FX v1 path was repaired at the right layer.

Live smoke showed the documented FX route returning 500 while the underlying forex data lane was healthy. The handler now reads the shared cached data-store path instead of making a separate service-role Supabase query.

- Removed the brittle direct Supabase service-key dependency from the public FX v1 route.
- Reused the same [forex-latest](#) live-data source already powering the working AfroTools forex lane.
- Kept sandbox behavior intact for [afro_test_*](#) keys and kept anonymous free testing for live FX examples.

The offer ladder is now clear enough for sales.

Free API

\$0/month. 100 requests/day and 3,000/month for verified developers testing fit.

API Growth

\$149/month. First paid pilot with 10,000 requests/day, setup support, and data-freshness review.

API Pro

\$499/month. Higher-volume product integrations with priority pilot support and endpoint-fit review.

Enterprise/custom

Negotiated limits, custom data scope, invoice billing, procurement, and dedicated support.

Best buyers

Payroll, HR, fintech, accounting, business media, research teams, and marketplaces serving African users.

Next move: deploy cleanly, then sell 10 API pilots.

- Deploy from a clean release path so the public site receives the FX fix and the rebuilt API pages.
- Use the new page as the sales asset for payroll, fintech, HR, accounting, and business-media conversations.
- Track pilot interest by endpoint: PAYE, VAT, FX, fuel, rates, countries.
- Next engineering milestone: self-serve paid activation, usage emails, and buyer-specific demo workspaces.
